Verified background checks for AI agents: facts about agents and their reviewers, proven from Ethereum into Creditcoin

Before one agent pays another, check what can actually be proven about it

BUIDL CTC 2026 Fall · Track: AI · Creditcoin CC3 Testnet + Attestcoin

Why a background check, and why on Creditcoin

- Creditcoin began as a credit history for people banks cannot see (Credal: 5M+ loan transactions, 337k users)
- AI agents are the next "unbanked": **19,000+** registered on ERC-8004, hired and paid by other agents, with no history a contract can check
- Tinjau is the bureau in Creditcoin's sense, not the lender or the judge: it records **proven facts** and names the **known gaps**; the party taking the risk sets the price
- The hiring escrow is the pricing step: its premium is the agent's **cost of credit**

The problem (Ethereum mainnet, measured 29 Aug 2026)

- 346 of 367 rated agents have exactly **one** reviewer; one wallet wrote **225** reviews for 195 agents
- 16 of 105 reviewers **own agents** and wrote **59%** of all feedback
- 60 days: **83%** of 14,771 registrations from owners holding ≥ 10 agents
- 0 of 12 sampled "paid on Ethereum" claims exist on Ethereum
- The spec's answer: "aggregation will happen off-chain" → trust an aggregator

Facts, not scores

- `GroundedFacts` admits data **only** through Attestcoin proofs of Ethereum txs from the official registries
- Reviews, reviewer seniority (years of activity before reviewing), holes in review indices, negatives, clones by owner / registrant / URI / minting tx, reviewer-owns-agents, **attestors registered when each fact was admitted**
- No weights. The consumer passes thresholds; anyone recomputes the same numbers from the same proofs

Attestcoin depth (all measured on-chain)

Surface	Use
BlockProver <code>0x0FD2</code> <code>verify</code>	every proof, inside the contract; 33 source txs admitted
<code>calculateTxIndex</code>	dedup across scouts (2nd cycle: 0 gas) + exact transfer ordering
AttestorStash <code>0x0FD4</code>	registered attestor count at admission; hirer can refuse thin quorums
ChainInfo <code>0x0FD3</code>	attested tip in-contract; hirer can refuse stale facts
History back to Mar 2022	reviewer seniority from 4.5-year-old txs (786 roots, 507k gas)
CC3 mainnet	same proof verifies on the mainnet precompile (127,746 gas)

Money follows facts

- AgentHireEscrow : premium = base + (max – base)·risk, paid to the agent's owner;
Gated if a reviewer's record has holes
- CoverageBounty : pays only for proofs that **change the decision in that call**; hurting evidence pays the same as helping evidence
- No reserve, no oracle, no admin

Who fills the bureau in

- Anyone can bring proofs; nobody can invent one: the precompile checks every proof, logs count only from the official registries
- Tinjau's own scout runs unattended every 3 hours; other scouts are welcome and deduplicated
- A dishonest scout can only **withhold**; the registry's review counter exposes the hole as a known gap
- Contributions change **completeness**, never **correctness**

The agent: GroundedScout (4 logged decisions)

- **R1** open bounties first, then requested or most-reviewed agents
- **R2** evidence both ways: complete records of senior reviewers (help); clones, conflicted reviewers, negatives (hurt)
- **R3** skip what is admitted; prove only when the bounty covers gas
- **R4** hire on its own thresholds, else fund a bounty
- Live: claimed bounty #0 with the decisive batch, hired 2 agents at 1%, refused a gated one
- **Track fit**: cryptographically verified cross-chain data in, autonomous on-chain transactions out, **no centralized oracle operator anywhere in the path**

Demo (mainnet data, Creditcoin txs, 13 Sep 2026)

- Agent **22771**: 3 reviewers active 97 days to 4 years before their first review → premium 1%, hired
- Agent **21548**: bounty claimed by the scout, then hired at 1%
- Agent **50283**: one reviewer who owns agents, review #97 proven and #1–96 not, 9 clone siblings → quote 20%, `hire` reverts `Gated(1)`
- `tinjau_verify` replays all 33 admitted txs from chain data: identical (the scout keeps adding more until the deadline)

AI where rules cannot keep up

- Review documents claim payments in marketplace-specific formats
- Gemini reads them and proposes (network, txHash) pairs (model ladder: falls to the next model on a quota error)
- Deterministic checks decide: hash must be in the document, chain must be Attestcoin-readable, prover + precompile confirm inclusion
- Live on agent 50283: **6 claimed payment transactions, 0 found on the chain they name**
- A report, never a fact on-chain; MCP tools let any agent ask the bureau before hiring

Limits we state up front

- Ethereum mainnet only (Sepolia dropped on purpose: free-to-mint registry entries); Base (most ERC-8004 activity) is out of reach today
- Facts are **admitted evidence with known gaps**, never a complete history (holes below the highest proven index show; a newer review nobody proved does not)
- Attestor count = attestors **registered at admission**, not the signers of one proof; `coveredThrough` = newest proven fact, not "all blocks checked"
- Clone density is a lower bound; aged wallets can be bought
- No consumer contract on Creditcoin yet; the escrow is an example
- Attestcoin moves trust to bonded attestors; it does not remove it (mainnet min bond is 0)
- Evidence Exchange: pay-only-for-decision-change and source-order resolution are live; batch claim, adjudication receipt and same-tx re-pricing are not

What's next

- **Ship the rest of Evidence Exchange:** batch claim, an adjudication receipt (decision before and after, predicate flipped), hire re-pricing in the same transaction
- **A consumer contract on Creditcoin** beyond our own escrow: any marketplace, lender or agent can already read `facts()` through `IAgentFacts`
- **More source chains** the moment Attestcoin can read them; the registry table is a constructor argument, so no rewrite
- **Who pays:** the hirer, as a premium on the job, and it goes to the agent's owner. A clean record is worth keeping
